If we carry a barometer with us, we can measure a decrease in pressure as weight of the air above decreases. Within the lower few thousand feet of the troposphere, pressure decreases roughly one inch for each 1, feet increase in altitude. The higher we go, the slower is the rate of decrease with height. The barometer is set by the manufacturer for a determined air pressure decreases about inch of mercury per feet Rules for weather-forecasts. 1.

GENERAL RULES AND PROCEDURES Â· AIR TRAFFIC SERVICES AIRSPACE When the barometric pressure is inches Hg. or less: to the current reported When an aircraft is en route on an instrument flight plan, air traffic controllers will The minimum safe altitude of a route is 19, feet MSL and the altimeter.

In short, a barometer measures atmospheric pressure. This pressure changes as weather systems move through an areaâ€”storms result in.

An ordinary aircraft altimeter is nothing more than a sensitive barometer, an instrument rule of thumb) is found at feet in the standard atmosphere. Before. They were much smaller and therefore cheaper, as mercury barometers had to be at least 3 feet tall for the air pressure to even out the liquid.
